

I claim:

-1-

A sill pan assembly for installation below a sill and providing a moisture barrier  
2 and including elongate multiple pan members partially overlapping one another, the  
improvement comprising,

4 inclined channel surfaces transversely on some of said pan members for the  
collection of moisture, said inclined channel surfaces each terminating at an extremity of  
6 an elongate pan member, upright channel surfaces on said some of the pan members  
contiguous with one of said inclined channel surfaces for passage of moisture from the  
8 last mentioned surfaces for discharge away from a building structure.

-2-

An elongate sill pan assembly for collecting moisture in a building structure and  
2 including pan members for installation below a window or door sill, the improvement  
comprising,

4 sloped channel surfaces on said pan members and inclined to the horizontal and  
located transversely of the pan members to receive moisture, and

6 upright channel surfaces on said pan members contiguous with said sloped  
channel surfaces for receiving moisture draining from the last mentioned surfaces for  
8 discharge away from the building structure.

In an elongate sill pan assembly constituting a moisture barrier and including,  
2 multiple pan members, the improvement comprising,  
multiple channel surfaces located transversely on said pan members and of the  
4 elongate pan assembly for the reception of moisture, said multiple channel surfaces  
inclined to the horizontal and terminating at an extremity of the elongate pan assembly,  
6 upright channel surfaces on said pan members each in communication with one of said  
multiple channel surfaces for reception of moisture draining from the last mentioned  
8 surfaces for the discharge of same.
